Image recognition

“Dog”

Image recognition

“Gray wall”

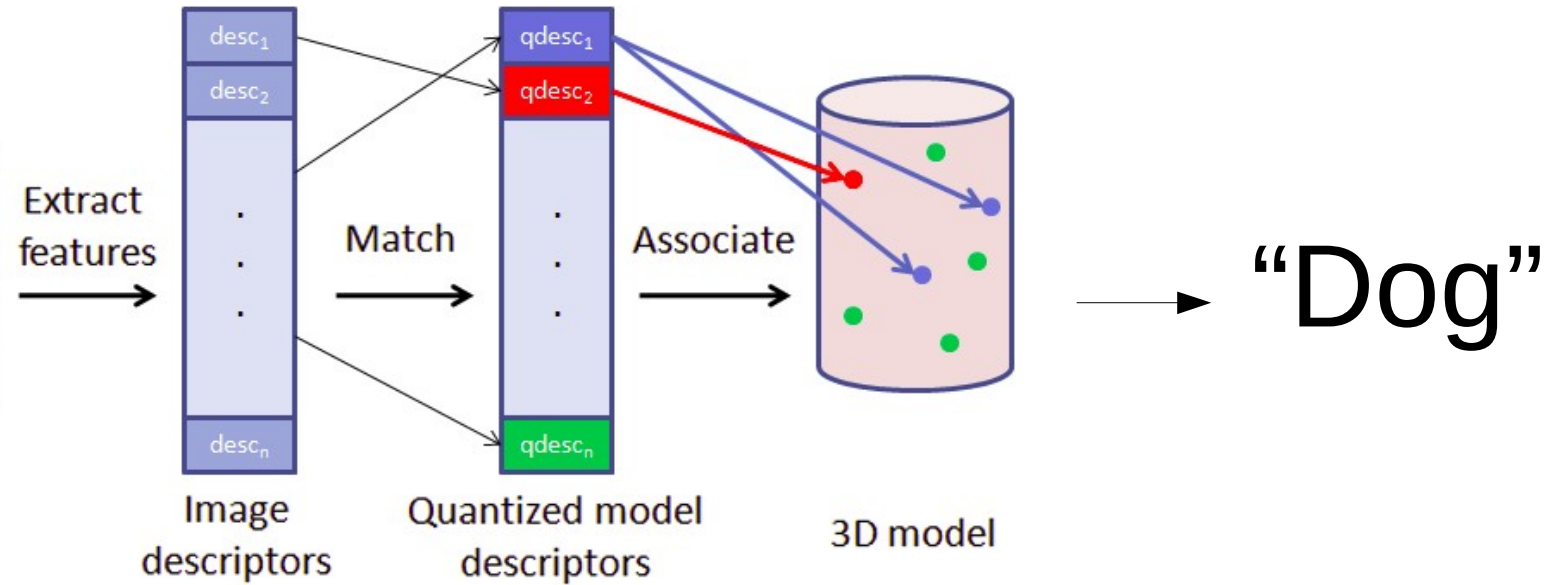

“Dog tongue”

“Dog”

<a particular kind
of dog>

“Animal sadism”

Classical approach

NN approach

What features could NN learn this way?

Problem

Should we require, say, “Dog ear” feature

- Linear combination can only select dog ear at a one (or a few) positions.
- Need to learn independent features for each position
- Next layer needs to react on “dog ear 0,0 or dog ear 0,1 or ... or dog ear 255,255”
- Introduce **a lot** of parameters and risk overfitting.

Idea: force all these “dog ear” features to use **exactly same weights**, shifting weight matrix each time.

Convolution

Idea: apply same filter to all patches

Convolution

5x5

1 _{x1}	1 _{x0}	1 _{x1}	0	0
0 _{x0}	1 _{x1}	1 _{x0}	1	0
0 _{x1}	0 _{x0}	1 _{x1}	1	1
0	0	1	1	0
0	1	1	0	0

Image

3x3 (5-3+1)

Convolved
Feature

Intuition: how cat-like is this square?

Convolution

Intuition: how cat-like is this square?

Convolution

Input image

Convolution
Kernel

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

Feature map

Intuition: how **edge-like** is this square?

Convolution

Image : 3 (RGB) x 100 px x 100 px

Filters: 100x(3x5x5)

Convolution

Image : 3 (RGB) x 100 px x 100 px

Filters: 100x(3x5x5)

100x96x96
~10⁶

Somewhat too many!

Pooling

Intuition: What is the max cat-likelihood over this area?

Pooling

Motivation:

- Reduce layer size by a factor
- Make NN less sensitive to small image shifts

Popular types:

- Max
- Mean(average)

Discrete Choices

Layer 2 Features

Layer 1 Features

Original Data

Convolutional NNs

Convolutional NNs

Quiz:

1) What is the blob size **after second pooling**

Convolutional NNs

Quiz:

2) How many image pixels does **one cell** after **second convolution** depend on?

Convolutional NNs

Quiz:

- 3) Which layer is hardest to compute?
- 4) Which layer has most independent parameters?

Inception-GoogLeNet

Convolution
Pooling
Softmax
Other

It is not a moon. It is a space station (c)

Other

Data augmentation

- Idea: we can get N times more data by tweaking images.
- If you rotate a cat 15 degrees, it's still a cat.
- Rotate, crop, zoom, flip horizontally, add noise, etc.
- Sound data: add background noises

Horizontal Flip

Crop

Rotate

Batch normalization

Problem:

- Consider a neuron in any layer beyond first
- At each iteration we tune it's weights towards better loss function
- But we also tune it's inputs. Some of them become larger, some – smaller
- Now the neuron needs to be re-tuned for it's new inputs

Batch normalization

TL;DR:

- It's usually a good idea to normalize linear model inputs
 - Every data science lecturer, ever

Batch normalization

Idea:

- We normalize activation of a hidden layer
(zero mean unit variance)

$$\hat{x}^k = \frac{x^k - E[x^k]}{\sqrt{Var[x^k]}}$$

- Now all neurons have ~same output range

Batch normalization

VS

Batch normalization

Good side effect #1:

- Vanishing gradient less a problem for sigmoid-like nonlinearities

Good side effect #2:

- We no longer need to train bias (+b term in $Wx+b$)

Other CV applications

to be covered in 3 weeks

Bounding box regression

Predict object bounding box

(x_0, y_0, w, h)

or several bounding boxes for multiple objects.

Applications examples:

- Face detection @ cameras
- Surveillance cameras
- Self-driving cars

IM:"001956" Conf=0.788438

IM:"004285" Conf=0.782058

Segmentation

Predict class for each pixel
(fully-convolutional networks)

Applications examples:

- Moar surveillance
- Brain scan labeling
- Map labeling

Image generation/transformation

- **Generation:** Given a set of reference images, learn to generate new images, resembling those you were given.
- **Transformation:** Given a set of reference images, learn to convert other images into ones resembling the reference set.
